Abstract

Let ψ be the polynomial Weyl-algebra endomorphism induced by the Alpöge–Fable Keller seed (restated) via $Q = F(q)$ and $P = J^{-T}p$. We freeze the algebraic domain of ψ and open a program to decide whether ψ admits a unital completely positive extension to a C^* completion (or a Hilbert C^* -module correspondence), explicitly *without* implementing dual F -translations on $L^2(\mathbb{R}^3)$. No channel capacity, gate, or computational advantage is claimed. Companion to the A001 deficiency note and Program B classification.

MSC: 46L07, 81S05, 47L90.

Status: draft (Program C / bet C1). Software track: EXOTIC-CCR C001.

1 Non-goals (binding)

- No dual F -translation unitary package on $L^2(\mathbb{R}^3)$ [1].
- No reversible-gate reading of a proper endomorphism.
- No advantage / capacity claims.

2 Domain (C1a)

Definition 1. Let $\mathcal{W}$ be the polynomial Weyl algebra over $\mathbb{C}$ on generators q_i, p_j with $[q_i, p_j] = \delta_{ij}$. With $B = J^{-T}$,

$$\psi(q_i) = F_i(q), \quad \psi(p_j) = \sum_k B_{jk}(q) p_k$$

(coefficients left of momenta) extends to a unital endomorphism $\psi : \mathcal{W} \rightarrow \mathcal{W}$.

Remark 1. ψ is not an automorphism (classical non-injectivity of F).

3 Program

1. **C1b**. Probe complete positivity on matrix levels over a standard positive cone, or record the first obstruction.
2. **C1c**. If positive: Stinespring/correspondence sketch. If not: axiomized no-go.
3. **T4**. Every constructive claim carries: does *not* implement dual F -translations on $L^2(\mathbb{R}^3)$.

4 Status

C1a domain frozen.

C1b (algebraic). With involution $q_i^* = q_i$, $p_j^* = p_j$ and real F, B , the map ψ is a unital $*$ -endomorphism of $\mathcal{W}$. Hence it preserves sums of hermitian squares at all matrix levels $\text{id}_n \otimes \psi$. Companion CAS re-checks $JB^T = I$ and reality of B on samples (`cas_psi_positivity_C1b_A001.json`): algebraic layer **PASS**.

C1b (C*/continuous). Whether ψ extends to a normal unital CP map on a C^* completion of the Weyl/CCR algebra remains **OPEN**. Since F is non-injective, ψ is not an automorphism; a CP extension would be a proper endomorphism realization, not a unitary conjugation.

5 Non-claims

No CP map on a C^* algebra is asserted constructed. No gates/channels/advantage. No dual F -translations on $L^2(\mathbb{R}^3)$.
