

Poisson and Weyl lifts of the Alpöge–Fable Keller
map
and nonunique self-adjoint realizations of a dual
transport operator

Abstract

We study the Alpöge–Fable Keller map F ($\det DF \equiv -2$, three-point collision). Novelty is Poisson/Weyl lifts and the dual transport operator $H = -iX_1$ on $C_c^\infty(\mathbb{R}^3)$, which has deficiency indices $(n_+, n_-) = (\infty, \infty)$: not essentially self-adjoint, infinitely many self-adjoint extensions, none preferred by algebraic CCR data. No gates, channels, or computational advantage. Seed discovery not claimed.

MSC: 47B25, 81S05, 14R15. **Software DOI:** 10.5281/zenodo.21477350 (v0.3.0).

Erratum. v0.2.2 pair $(0, \infty)$ withdrawn; corrected (∞, ∞) .

1 Setup

$$\begin{aligned}F_0 &= (1 + xy)^3 z + y^2(1 + xy)(4 + 3xy), \\F_1 &= y + 3x(1 + xy)^2 z + 3xy^2(4 + 3xy), \\F_2 &= 2x - 3x^2 y - x^3 z.\end{aligned}$$

$$B = J^{-T}, \quad X_j = \sum_k B_{jk} \partial_{q_k}, \quad H = -iX_1.$$

2 Main theorems

Theorem 1 (A). $\det DF \equiv -2$; *three-point collision*; F *noninjective*. (*Alpöge–Fable seed restated.*)

Theorem 2 (B–C). *Cotangent lift Φ is polynomial Poisson and noninjective. Dual fields commute and are divergence-free (Piola); $H_j = -iX_j$ symmetric on C_c^∞ .*

Theorem 3 (D). X_1 *incomplete*: *explicit curve through $(1, 0, 0)$ escapes as $t \rightarrow \frac{1}{2}^-$, with $F(\gamma(t)) = (0, t, 2)$.*

Theorem 4 (F). *In coordinates $(a, s, c) = F(q)$, $X_1 = \partial_s$ and $dq = \frac{1}{2} da ds dc$. Open forward wall near $(a, c) = (0, 2)$ and backward wall near $(1/54, 2)$ yield L^2 deficiency functions $u_\pm$, hence $(n_+, n_-) = (\infty, \infty)$.*

Theorem 5 (E). H *is not essentially self-adjoint on $C_c^\infty(\mathbb{R}^3)$.*

Corollary 1. *Infinitely many self-adjoint extensions exist; algebraic data select none.*

3 Non-claims

No unitary gate, channel, CP map, or computational advantage. No discovery claim for F . No preferred physical extension.
